# ECOFEN

Module for the NS-3 network simulator

- Energy Model: measure the energy consumption
  - Nodes
  - Interfaces
- Green functions: reduce the energy consumption
  - Node
    - ON/OFF
  - Interfaces
    - ON/OFF
    - Adaptive Link Rate (ALR)
    - Energy Efficient Ethernet (802.3az)

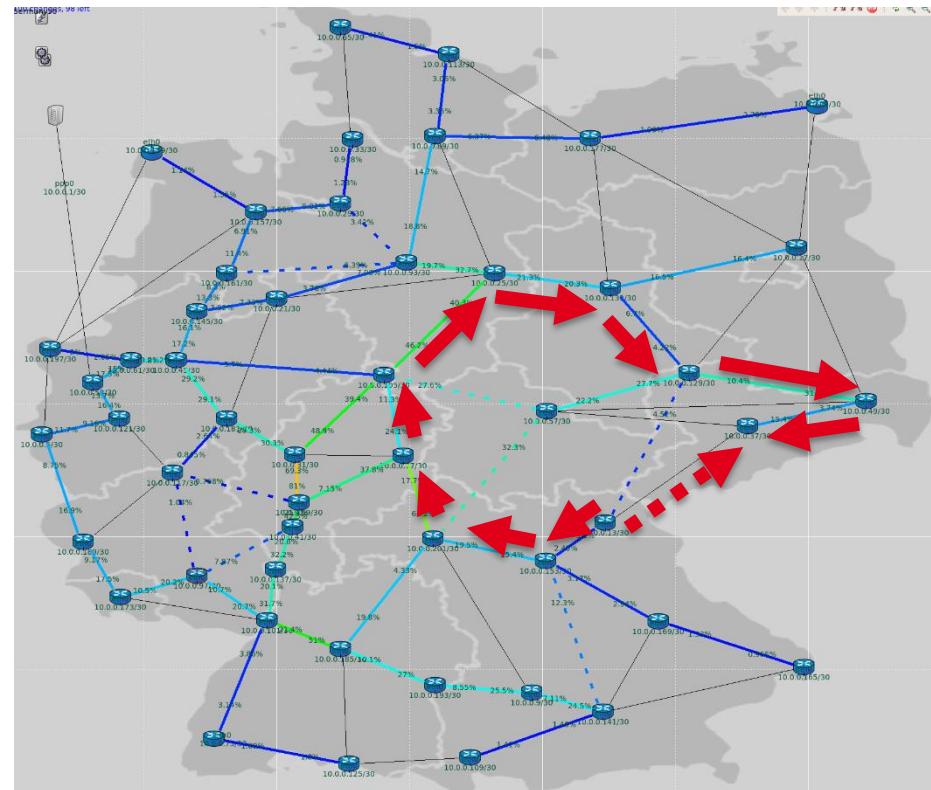

\*<http://people.irisa.fr/Anne-Cecile.Orgerie/ECOFEN/index.html>

# Power Saving in Wired Networks

Actual work:

- Sleep modes and Power Aware Routing
  - Reroute and turn off/on

To be done:

- Adaptive Link Rate
- Energy Efficient Ethernet

?

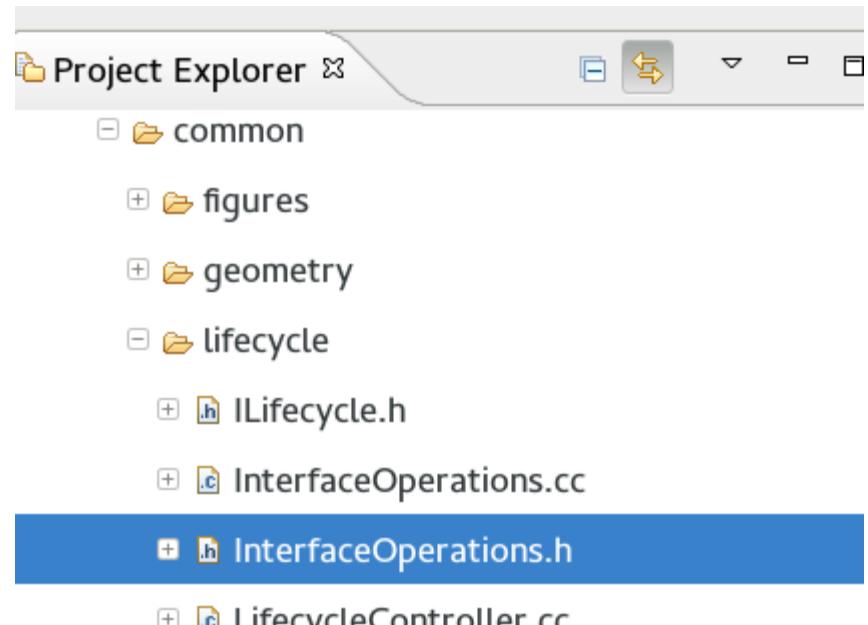

# ECOFEN in OMNeT++/INET?

Model the power consumption

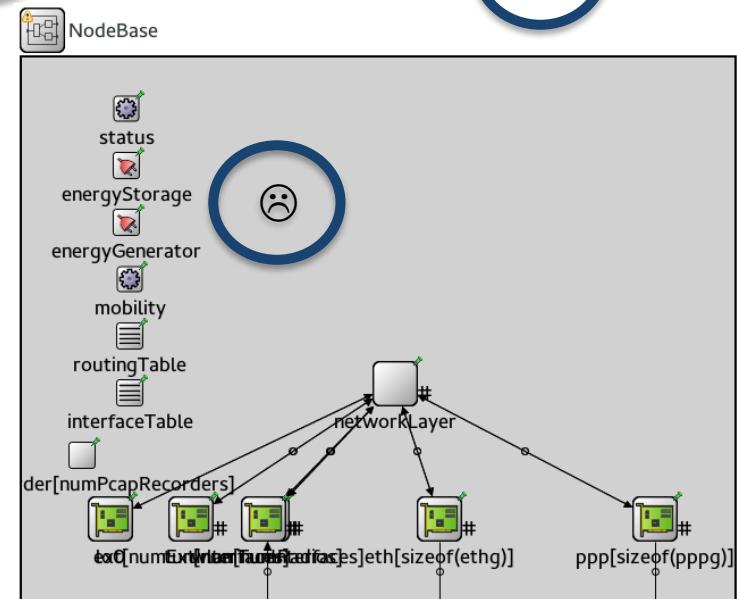

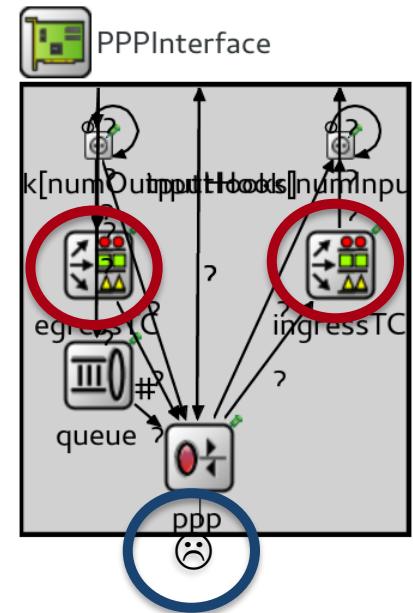

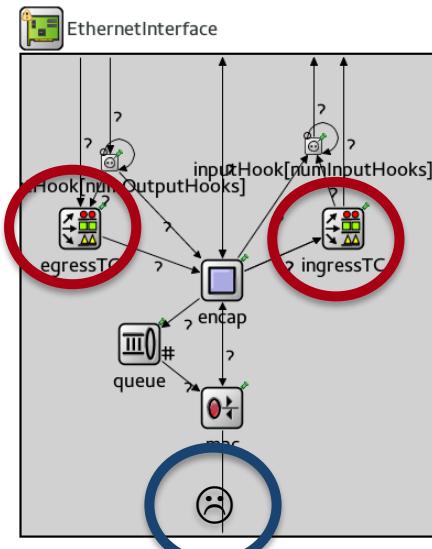

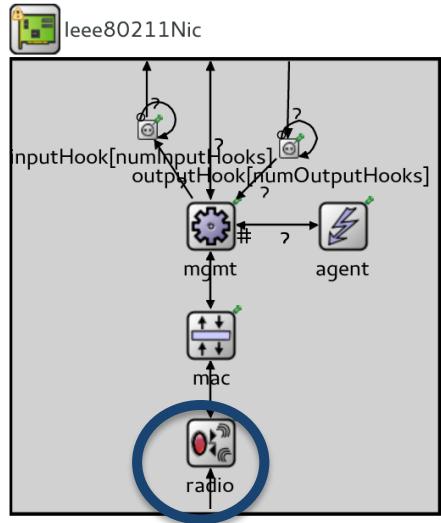

- ☺ new power model in INET 3.0

Switch OFF/ON

- ☺ lifecycle controller

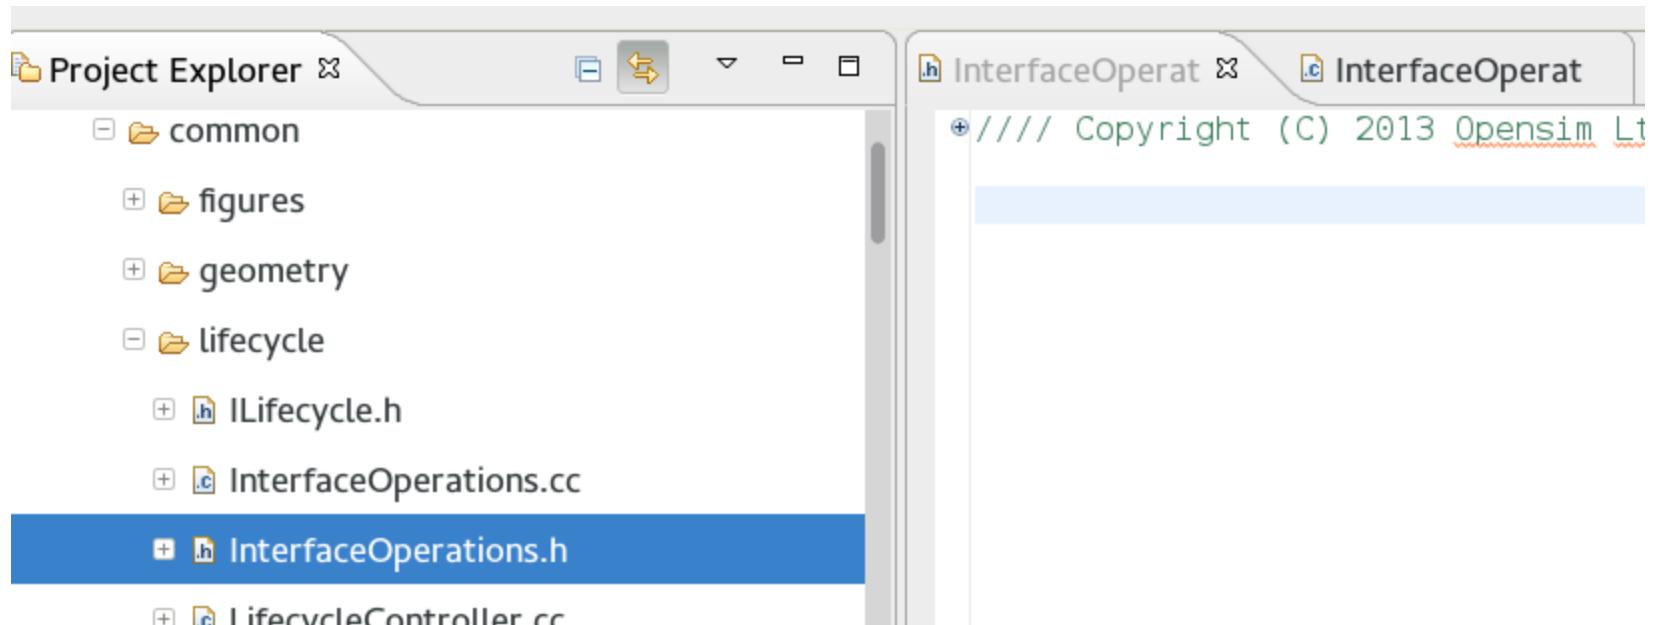

# Model the power consumption

# Switch OFF/ON

```
bool BGPRouting::handleOperationStage(LifecycleOperation *operation, int
{
    throw cRuntimeError("Lifecycle operation support not implemented");
}

bool IPv6::handleOperati
{
    throw cRuntimeError(
}
```

# ECOFEN in OMNeT++?

Is the community interested?

Changes must be applied all over INET

Lots of unimplemented features (lifecycle controller)

Can be confusing for a new user

# Thank you
