

# Simulating **LISP**-Based **Multilink** Communications in **Aeronautical Networks**

Chiara Caiazza, Antonio Viridis, Giovanni Stea

University of Pisa

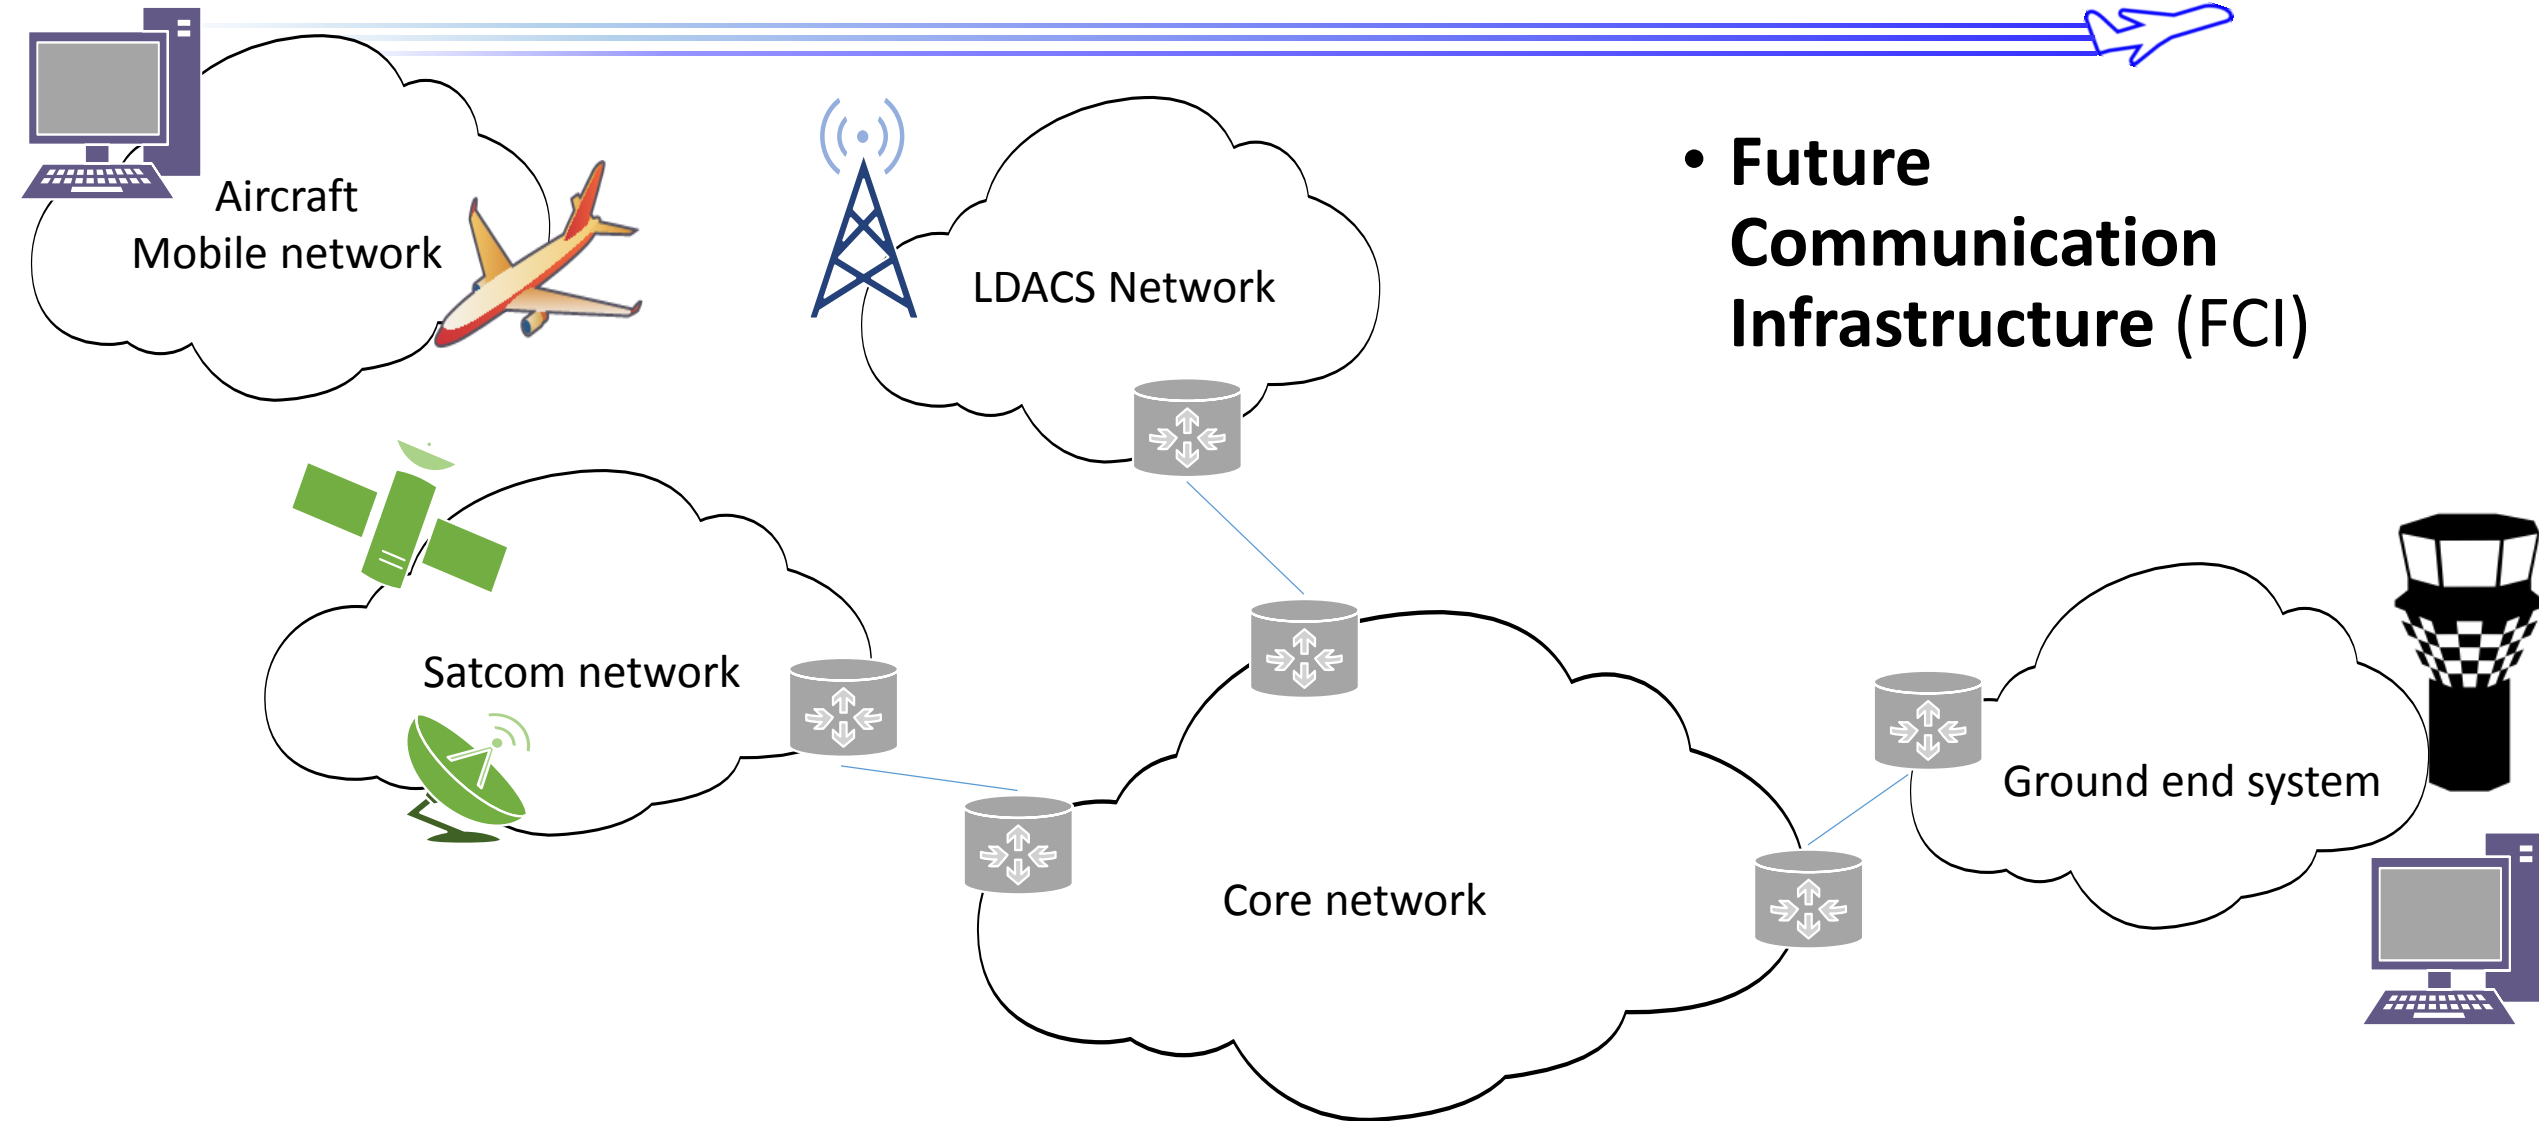

# Outline

---

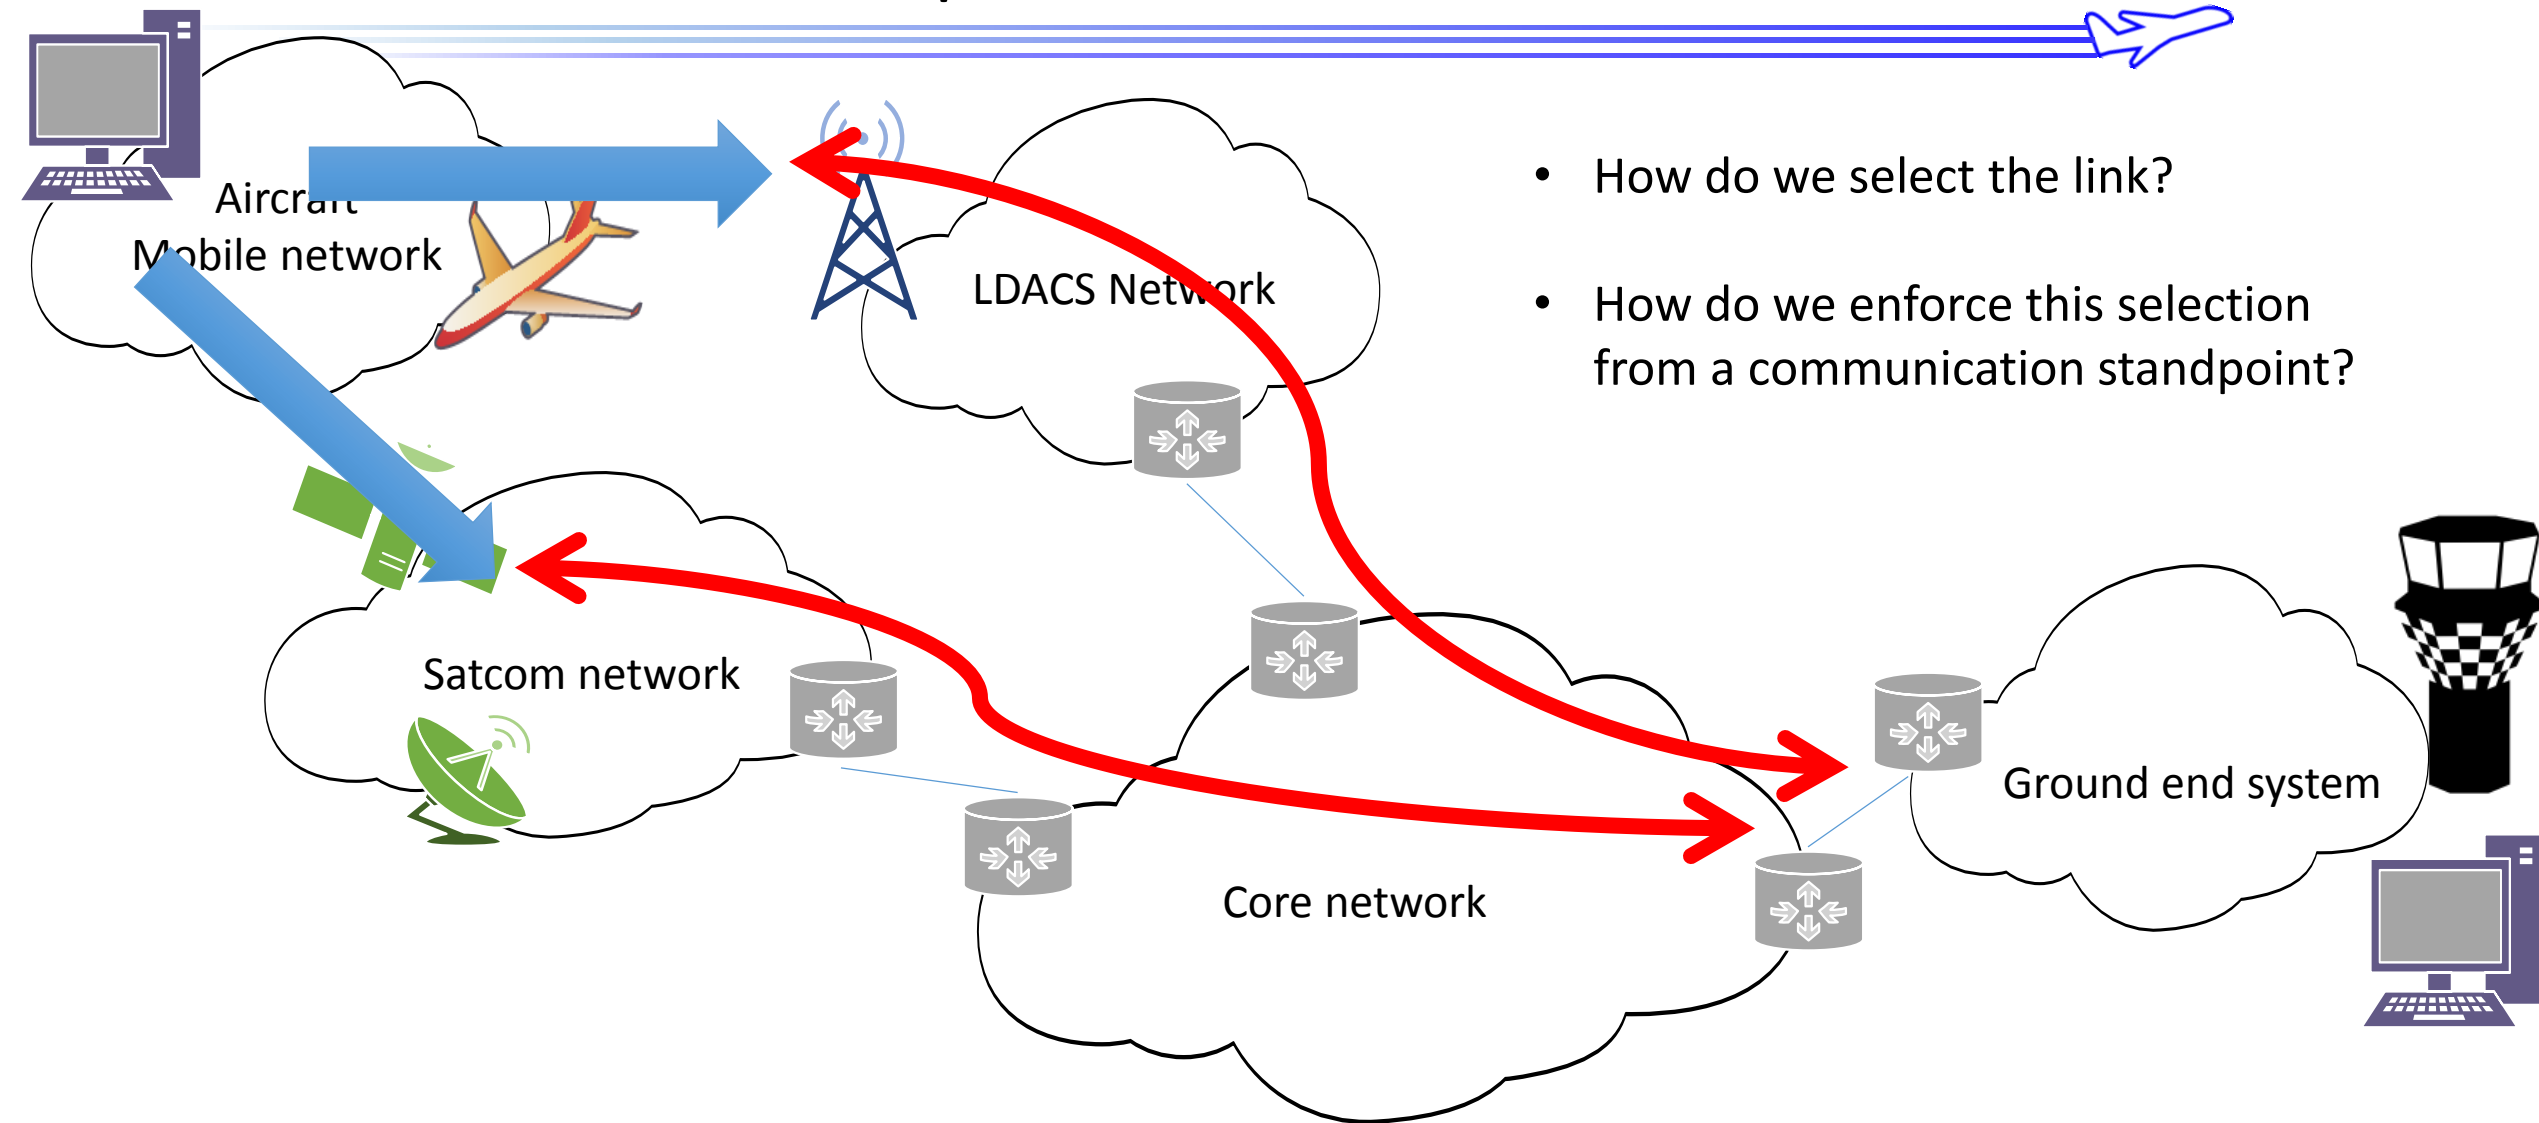

- Overview of aeronautical communications
- Handover and Multilink
- LISP protocol
- Performance evaluation
- Conclusions

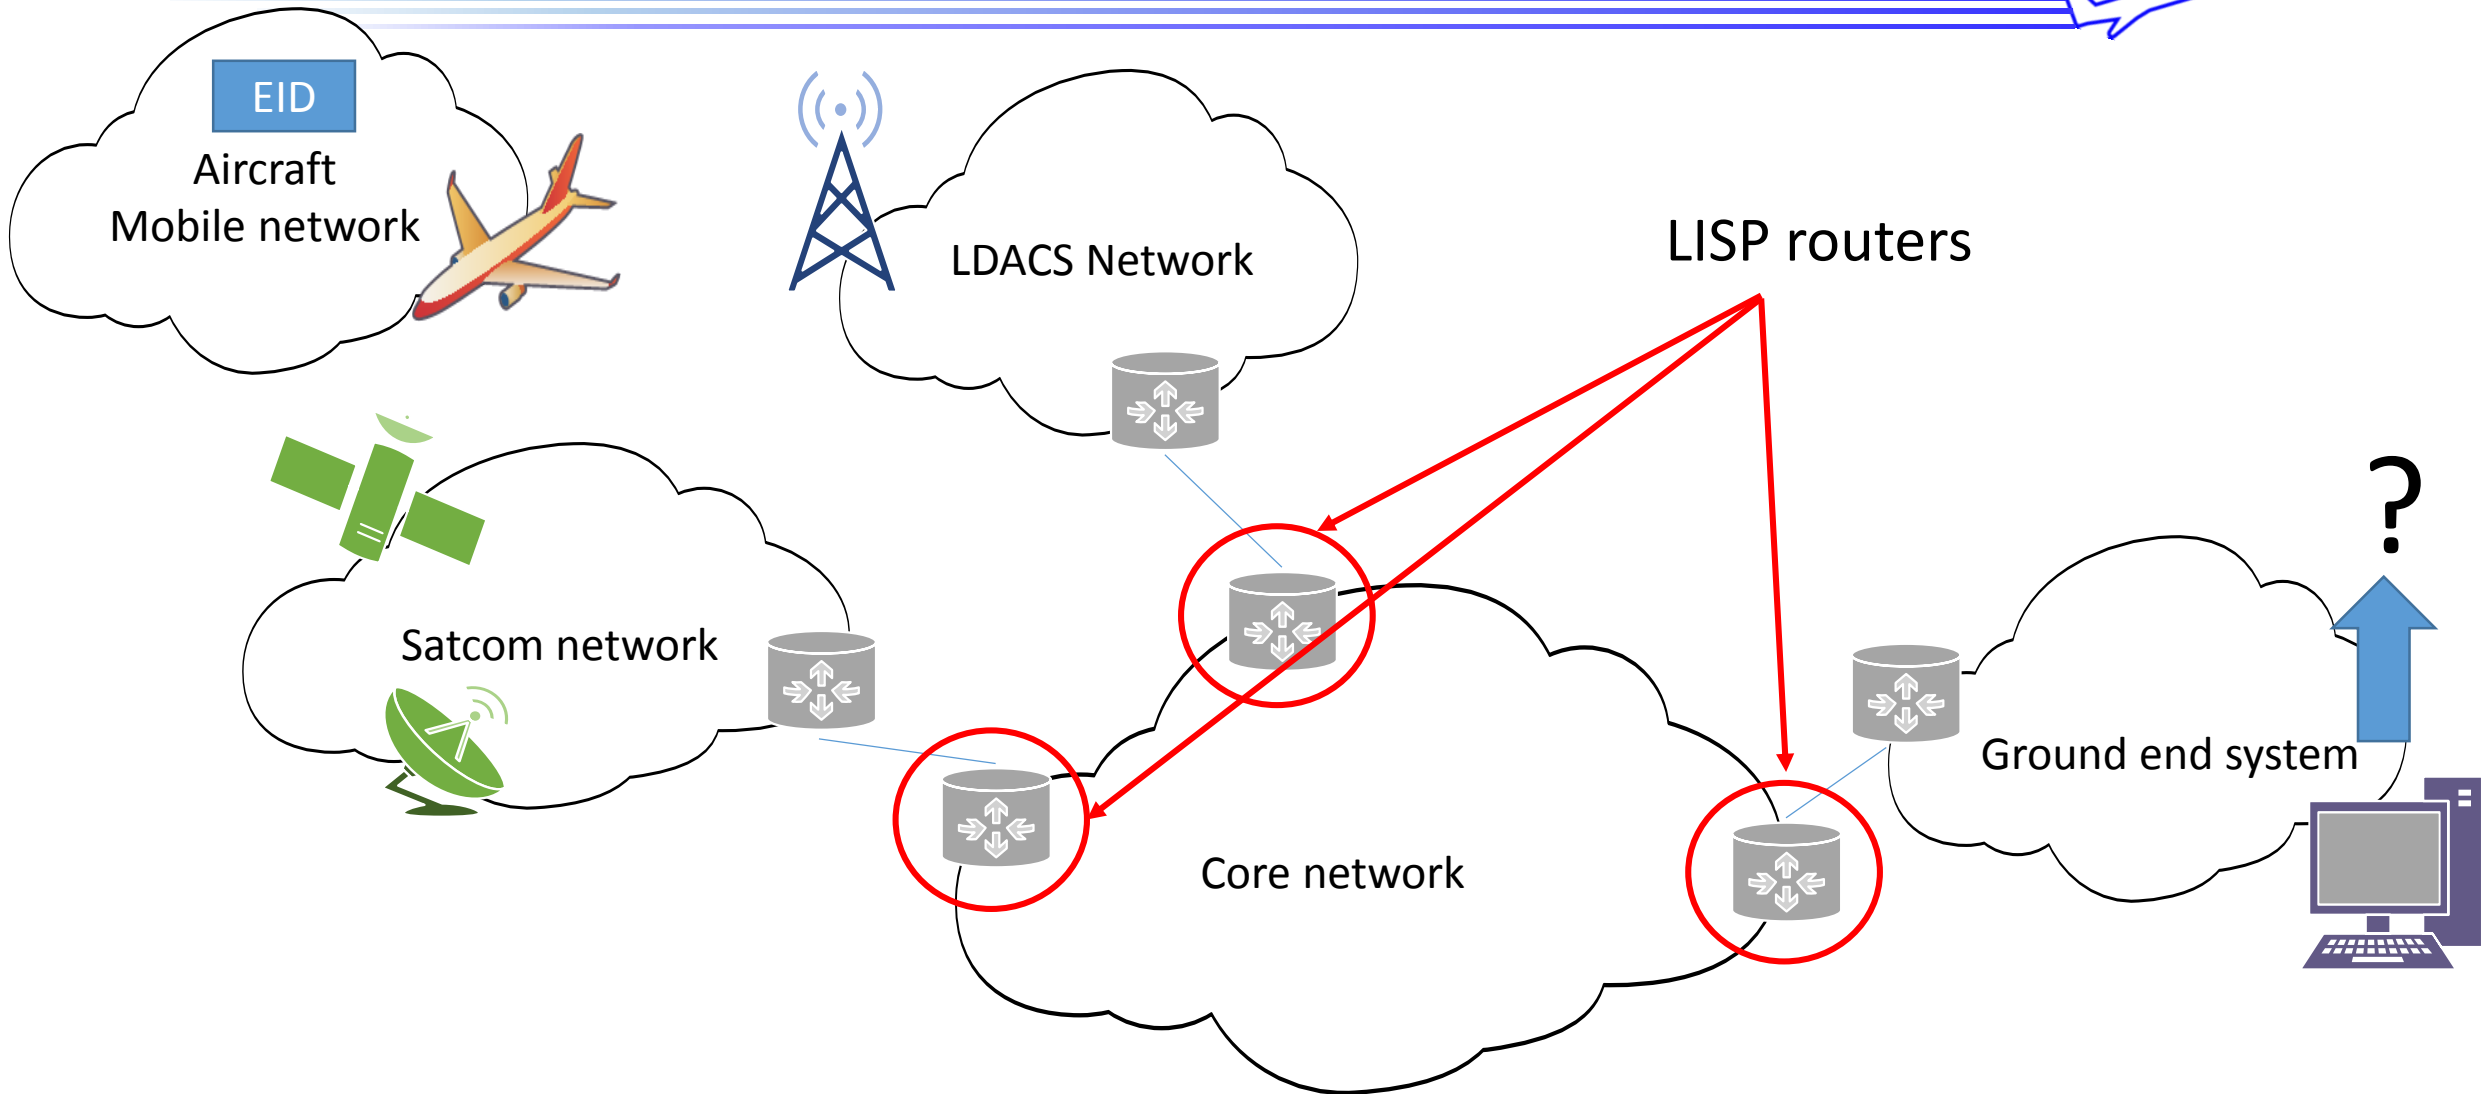

# Aeronautical communications

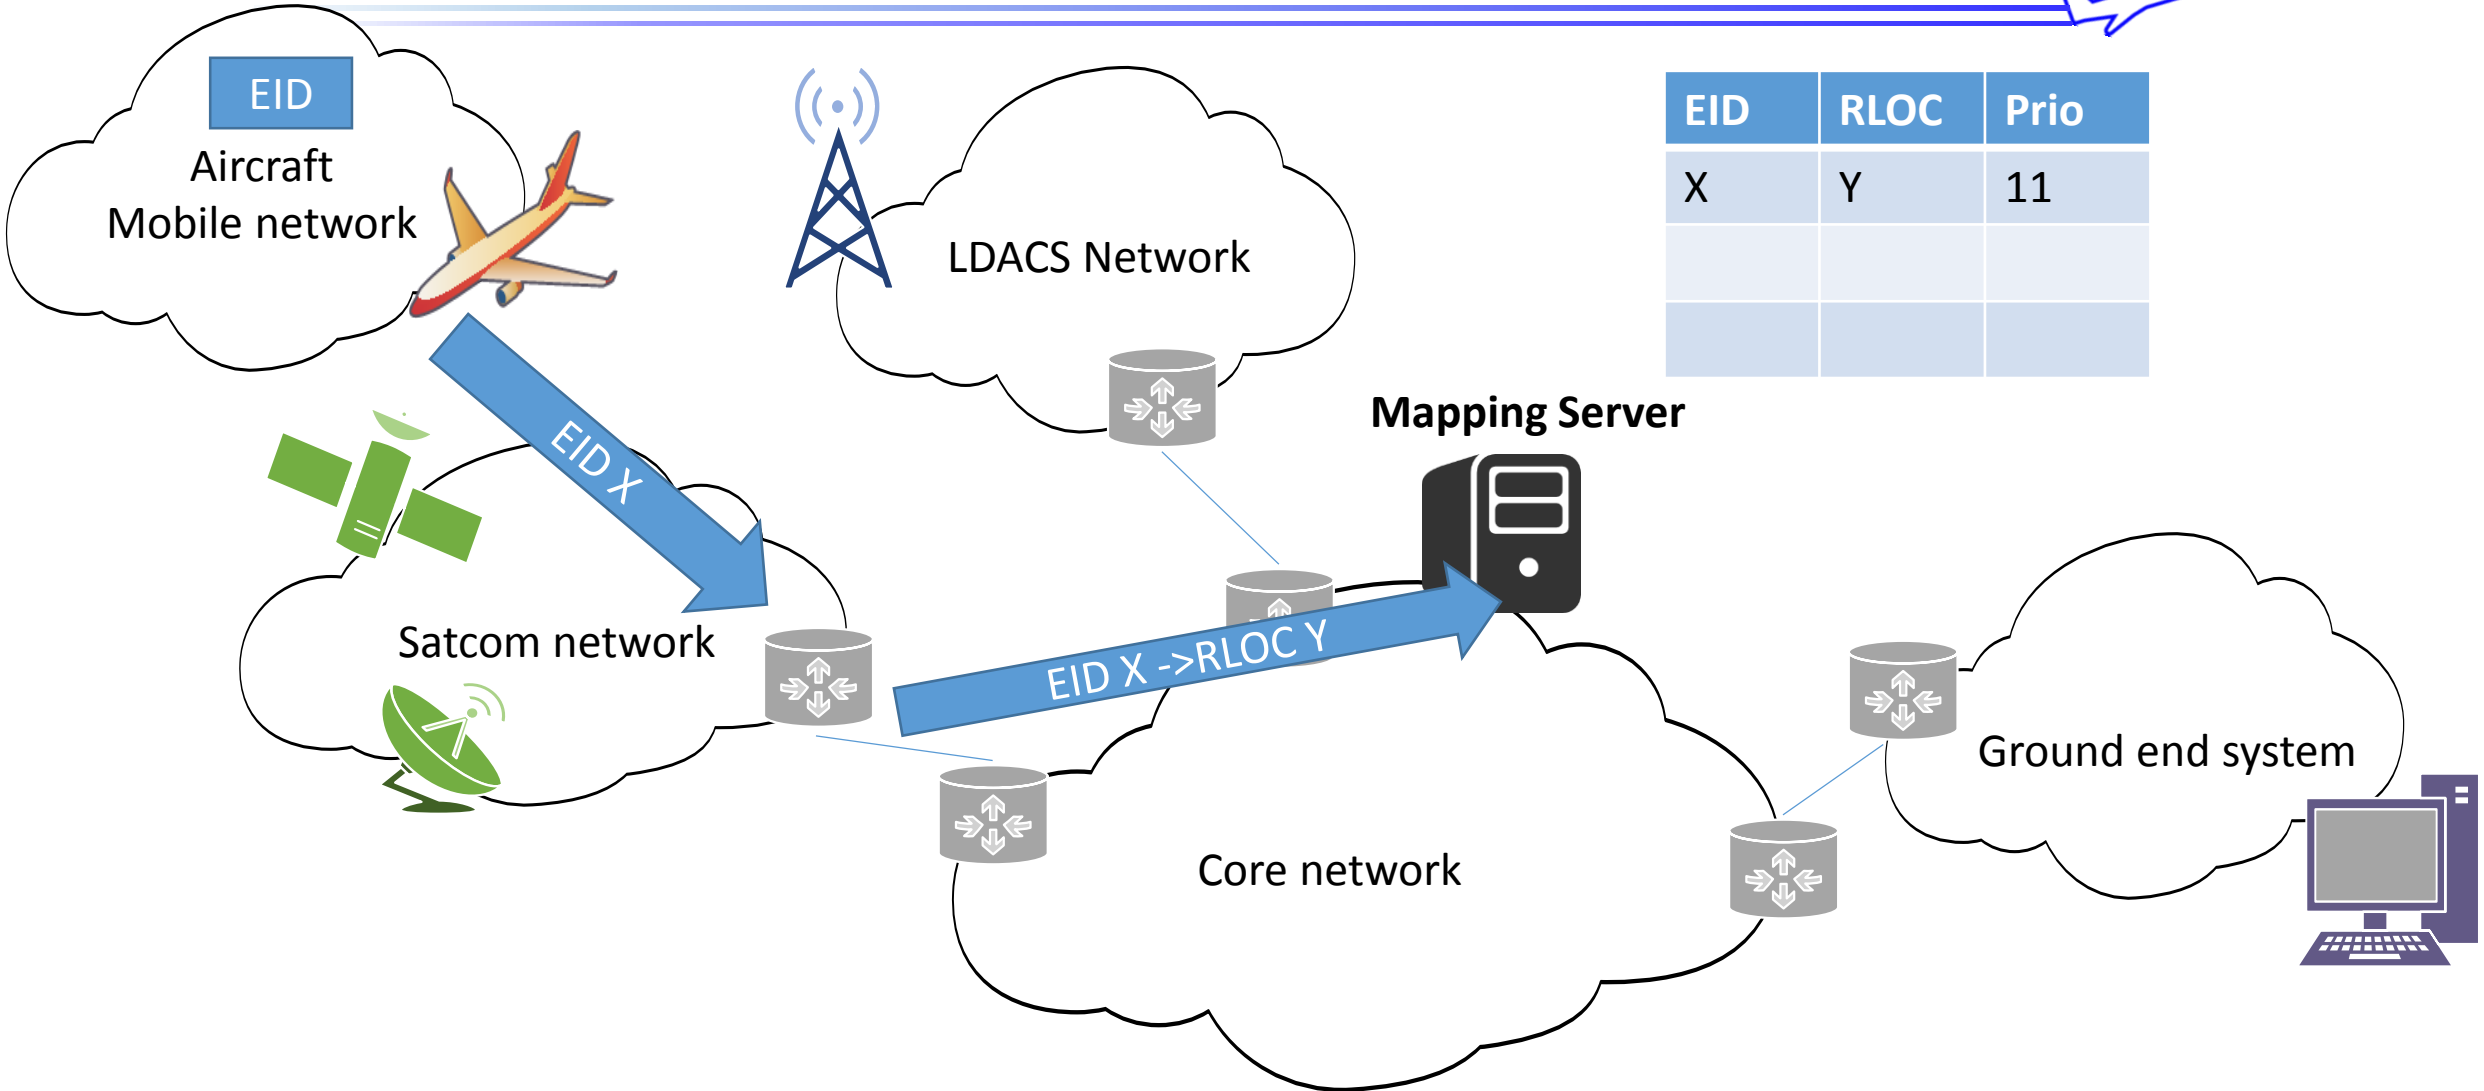

# Multilink Concept

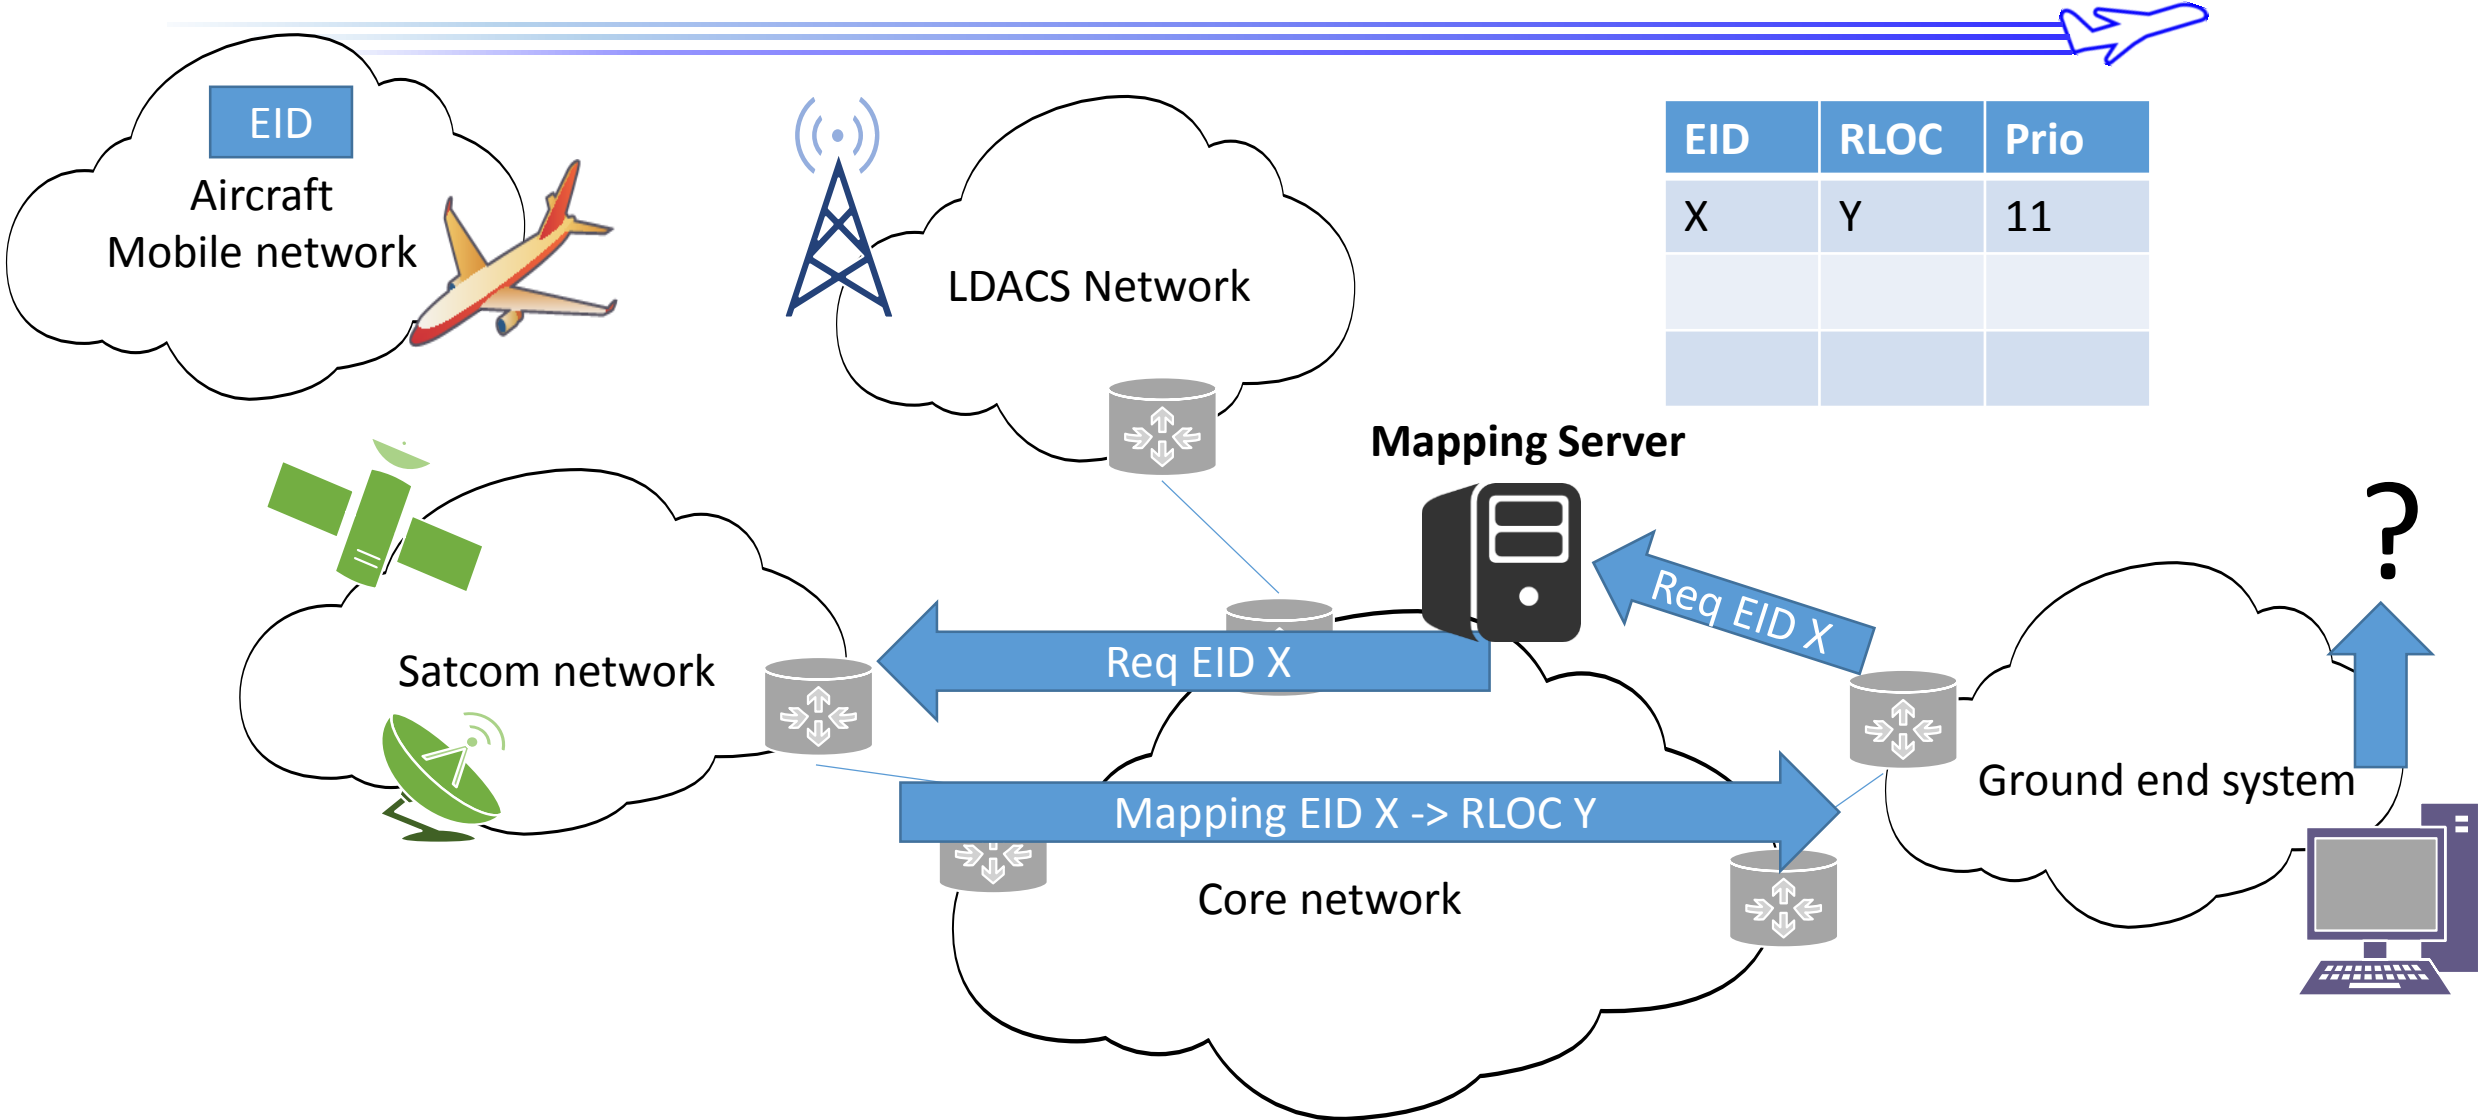

# Locator/Identifier Separation Protocol (LISP)

# Registration: EID to RLOC

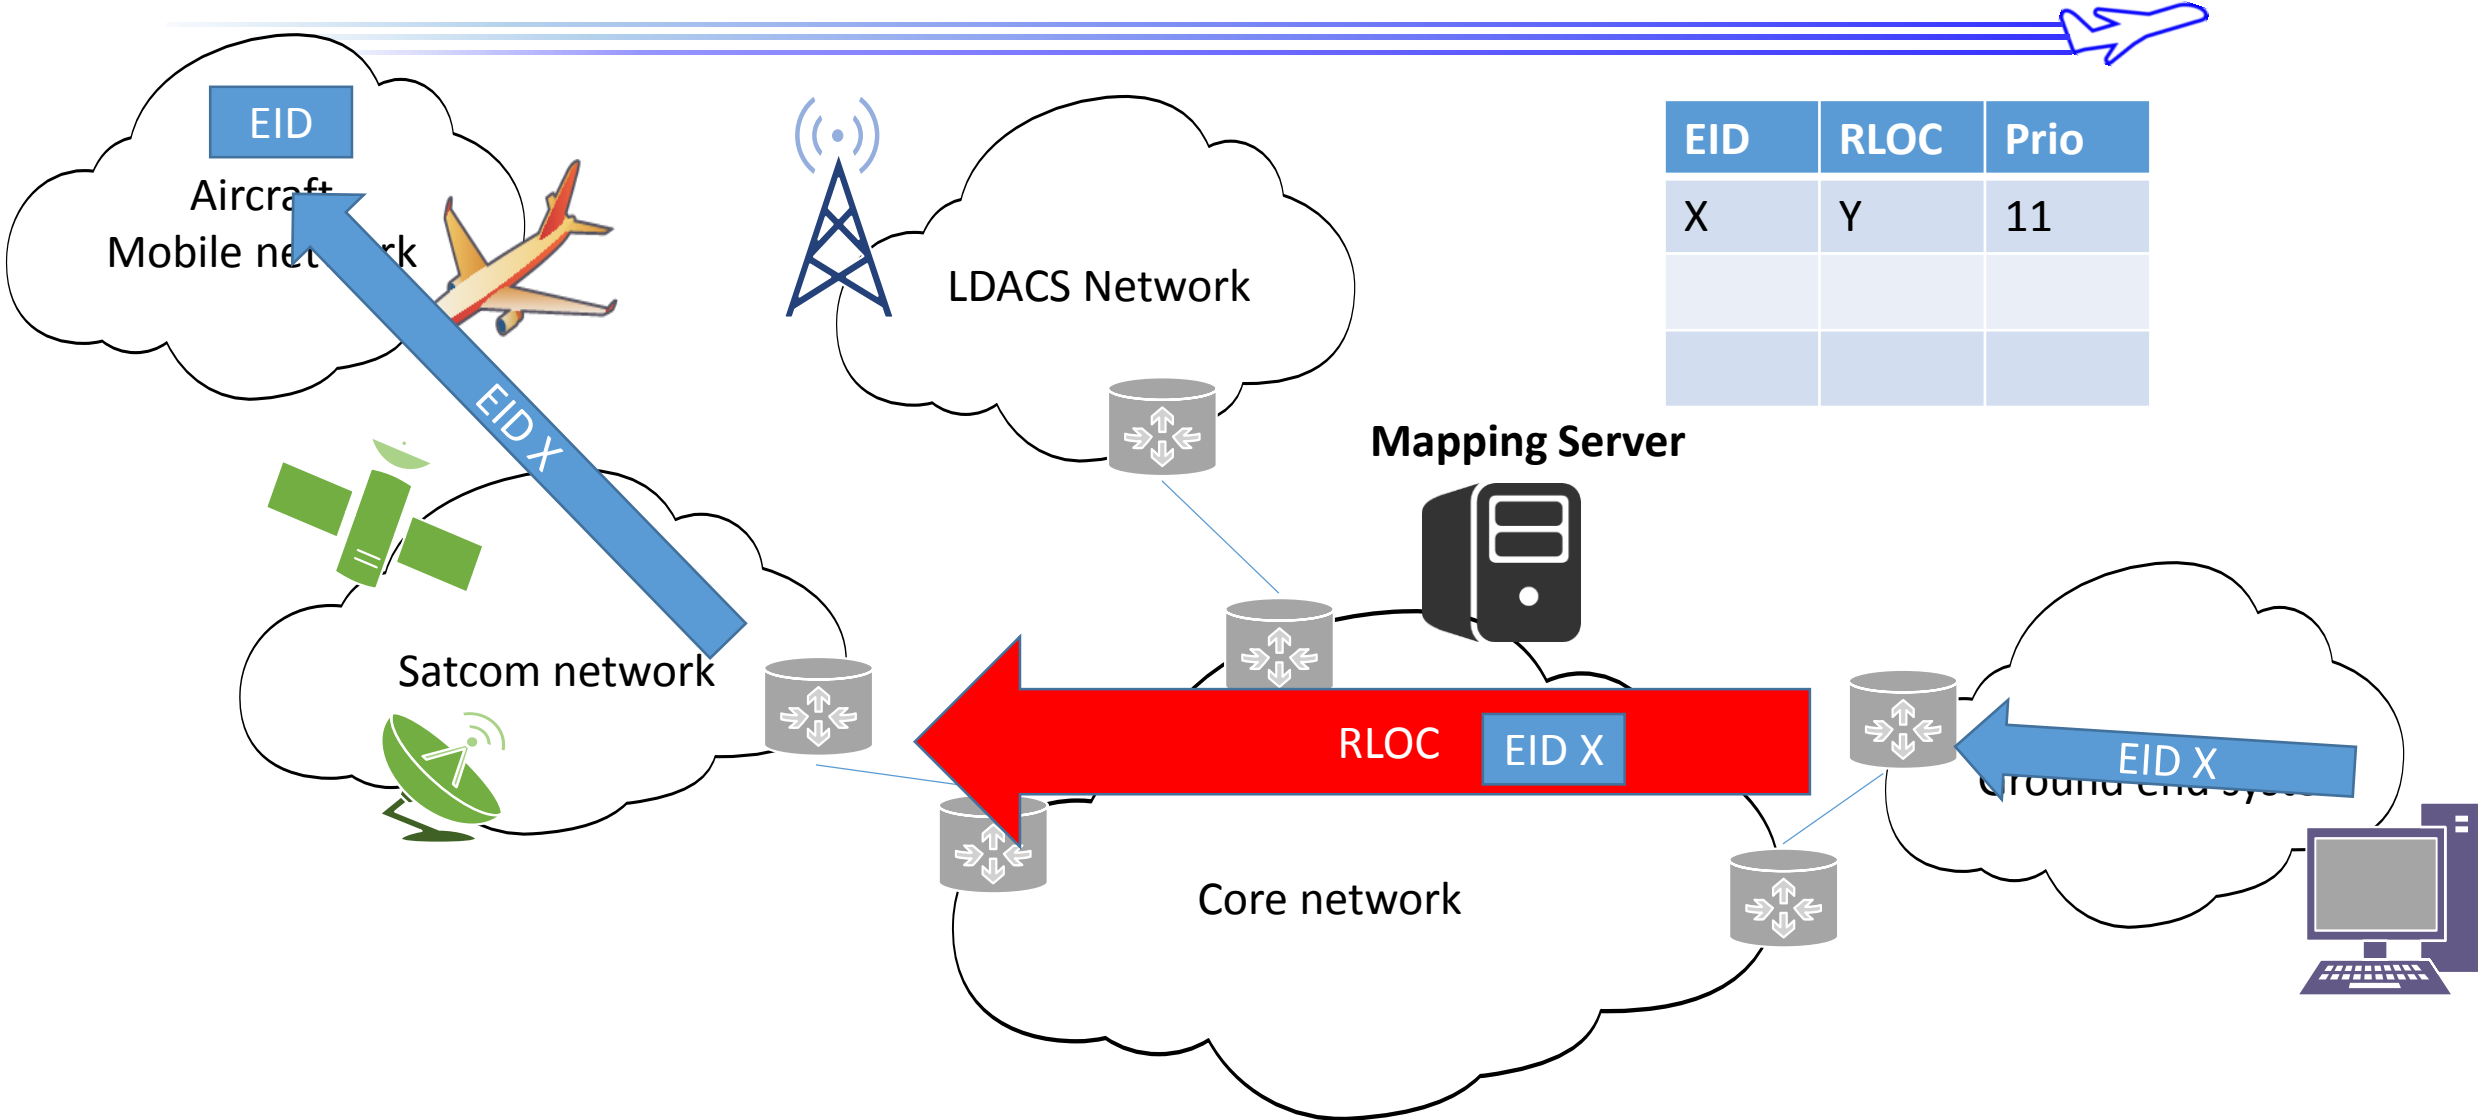

# Map Request

EID	RLOC	Prio
X	Y	11

# Data Transmission

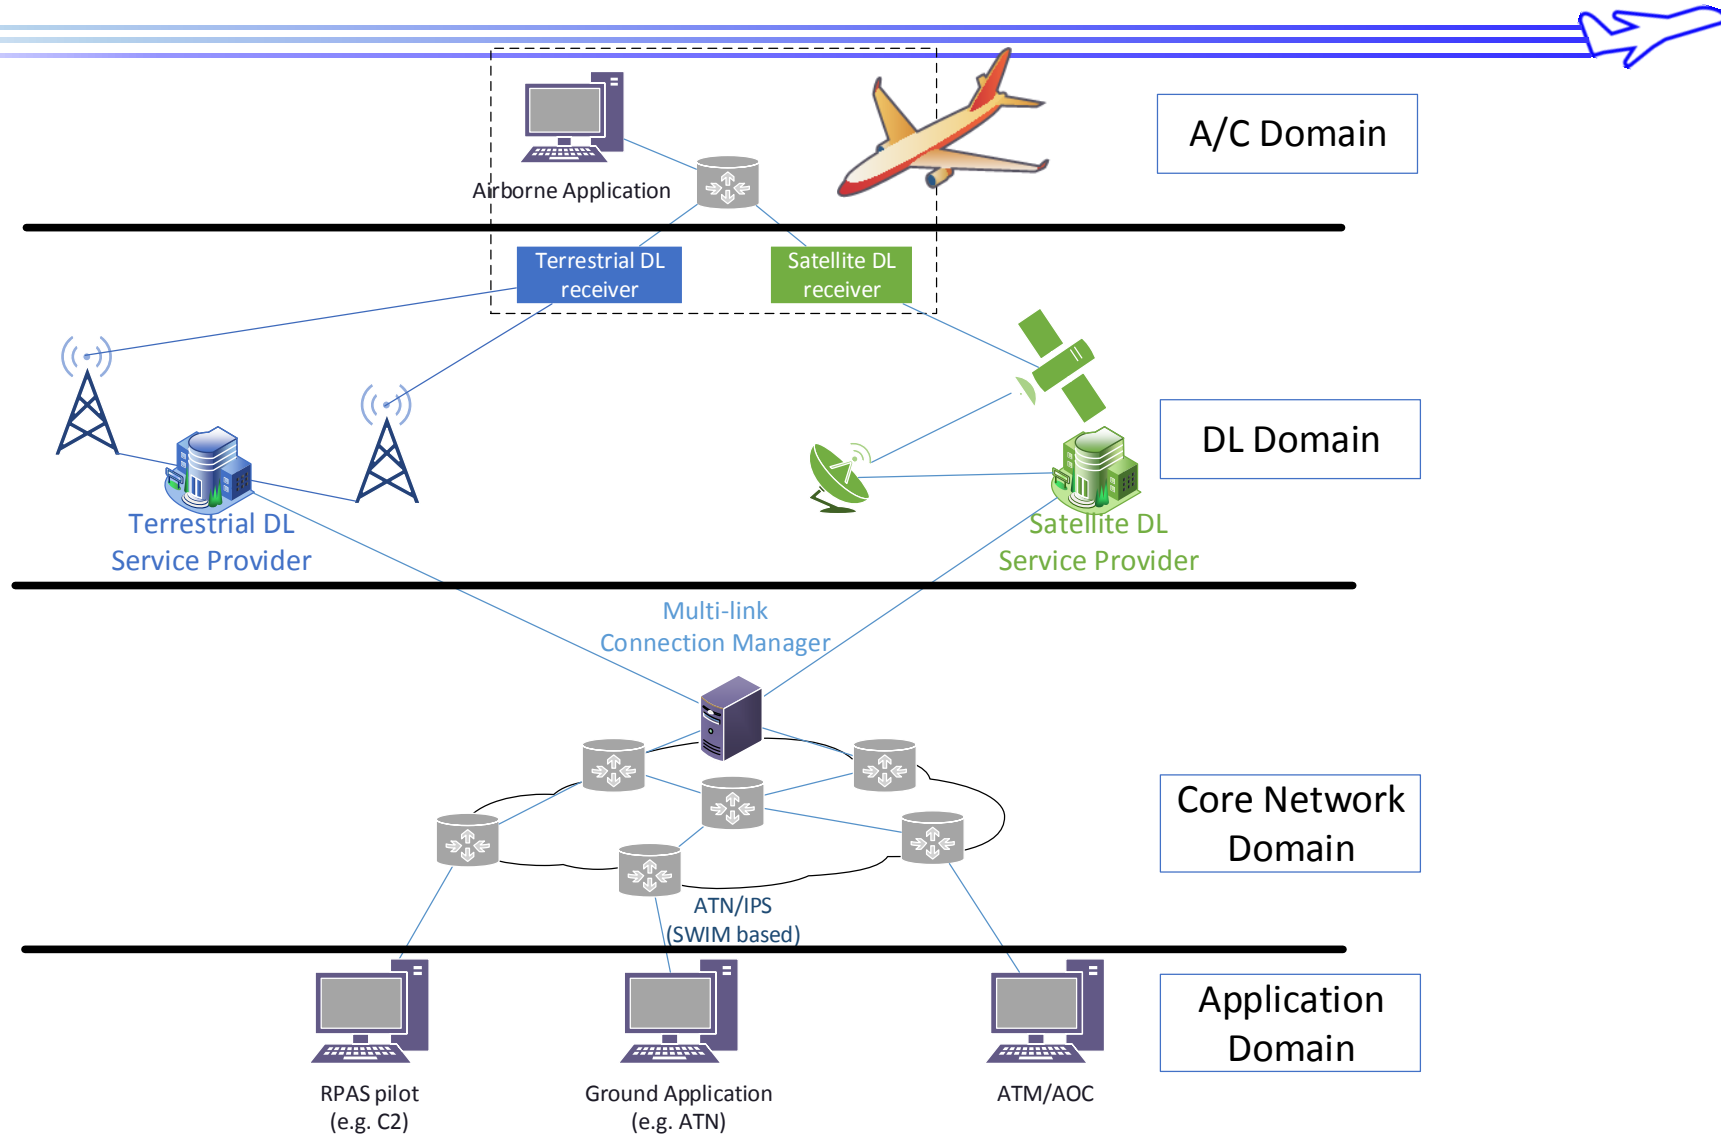

# Motivation

---

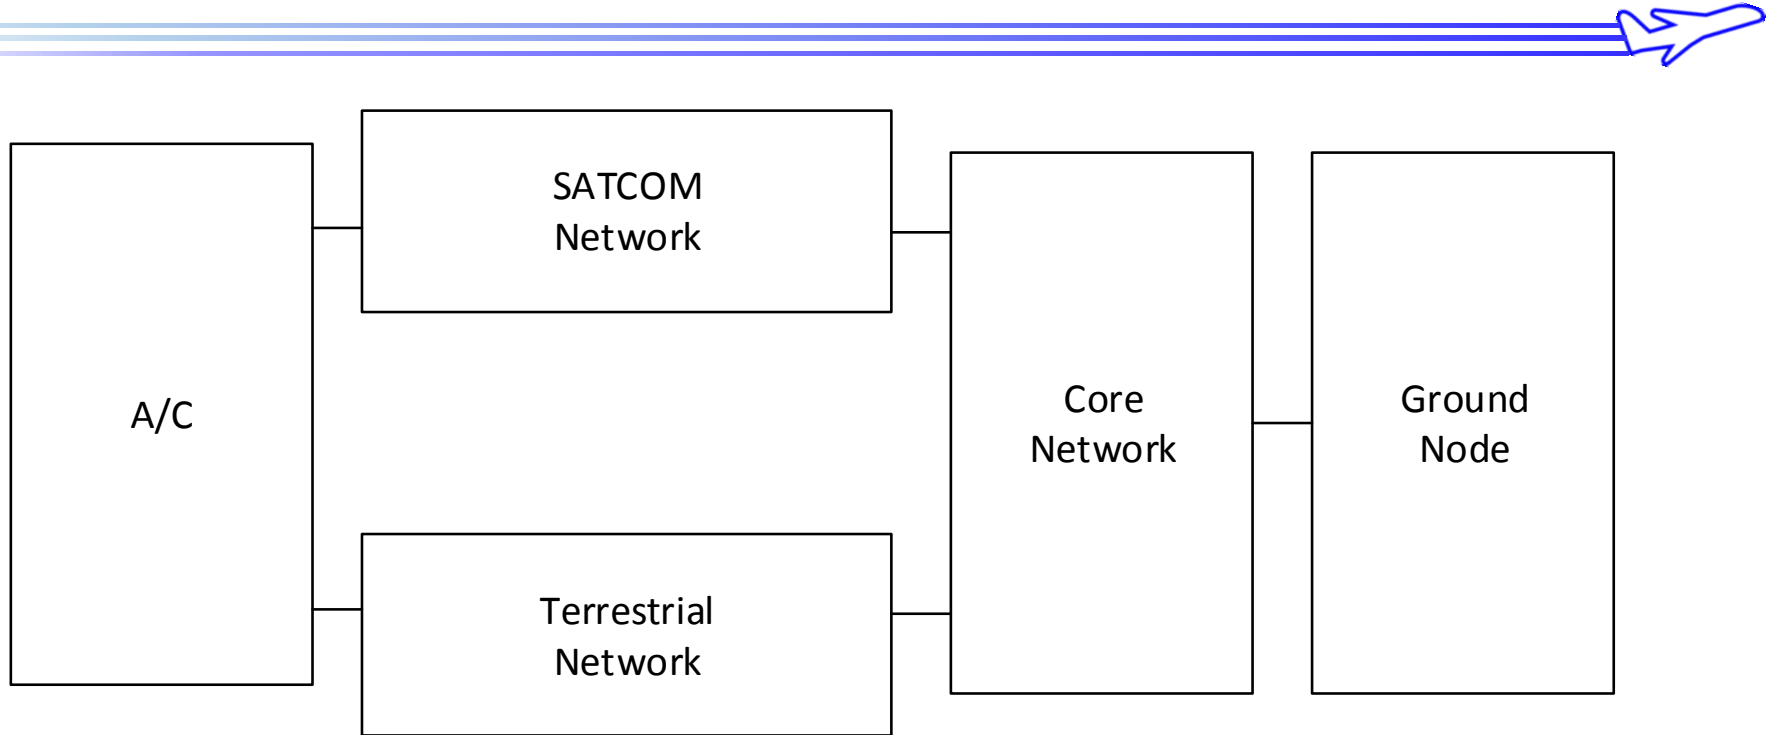

- Studying **Aeronautical communications** in a **Multilink environment**
- Evaluating the impact of communication protocols in terms of:
  - System **overhead** (number of additional messages)
  - System **load** (computation at critical nodes, storage capacity)
- Extensible to:
  - Multiple DataLinks
  - Multiple Applications and Communication Services

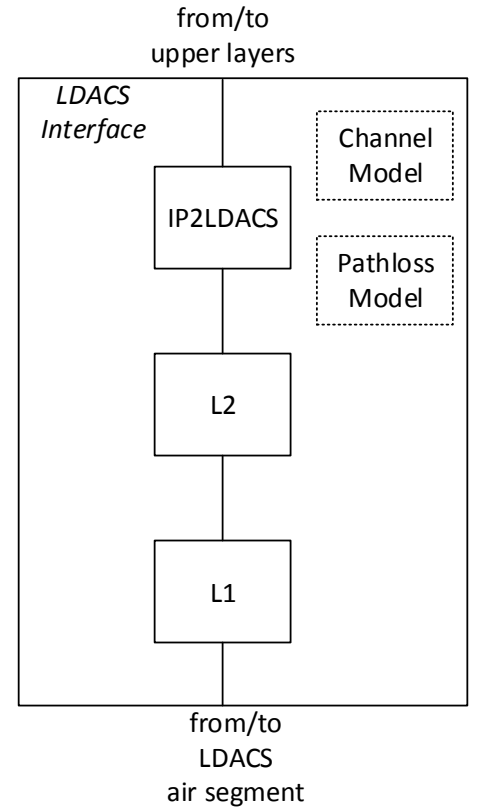

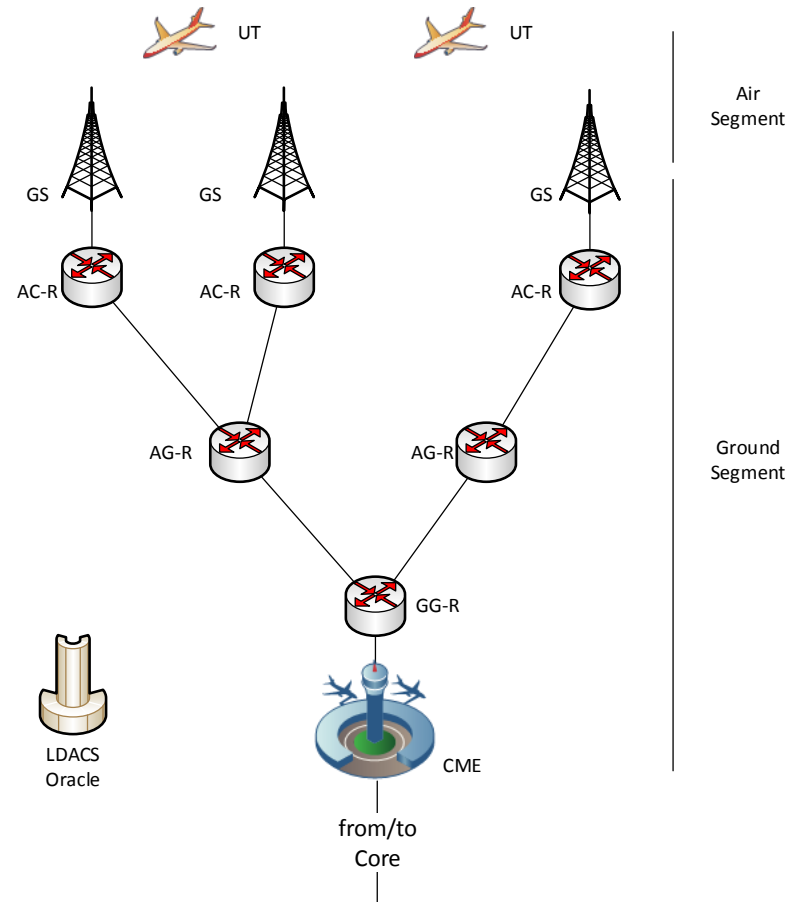

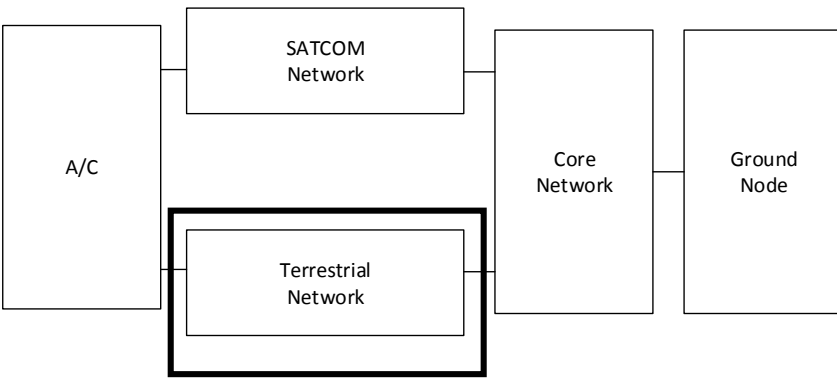

# SAPIENT Simulator: Modeling the Communication Network

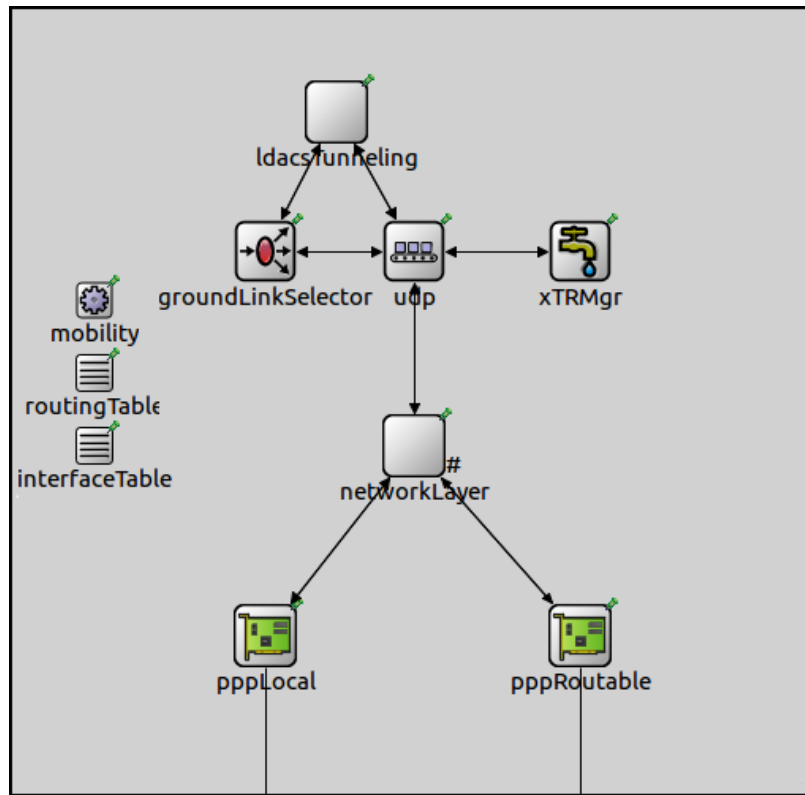

# SAPIENT Simulator

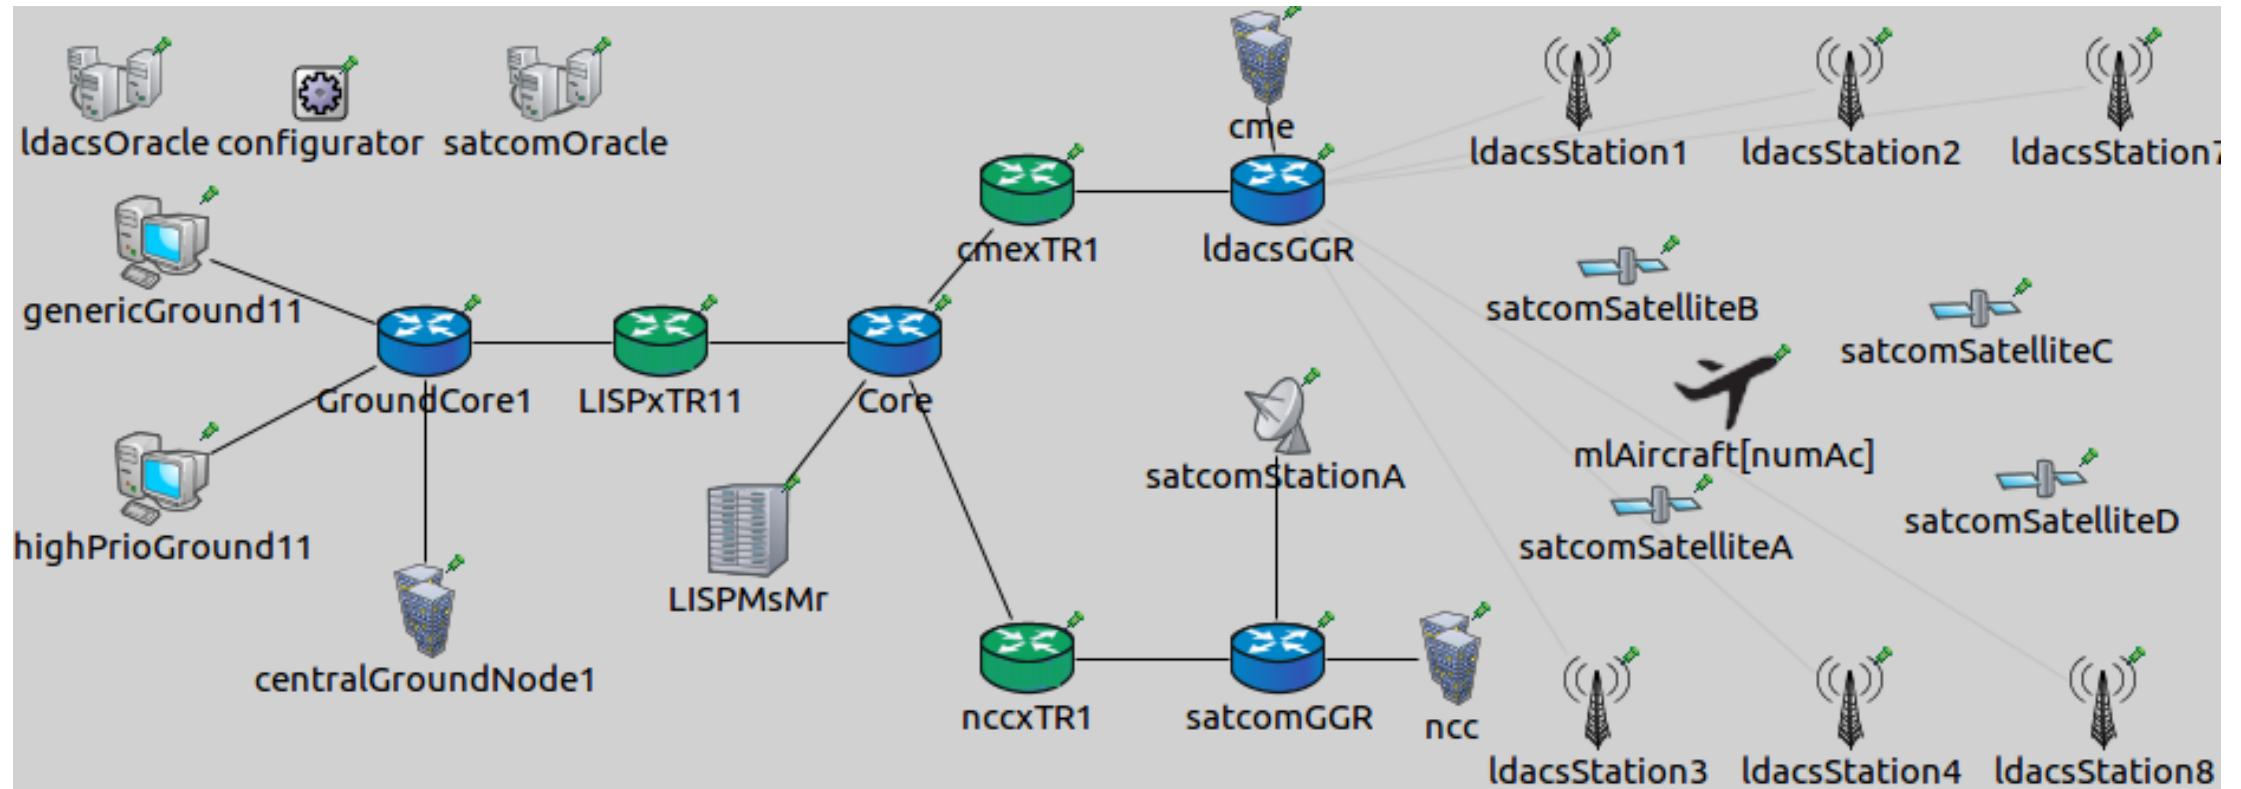

# Example: Terrestrial DL (LDACS)

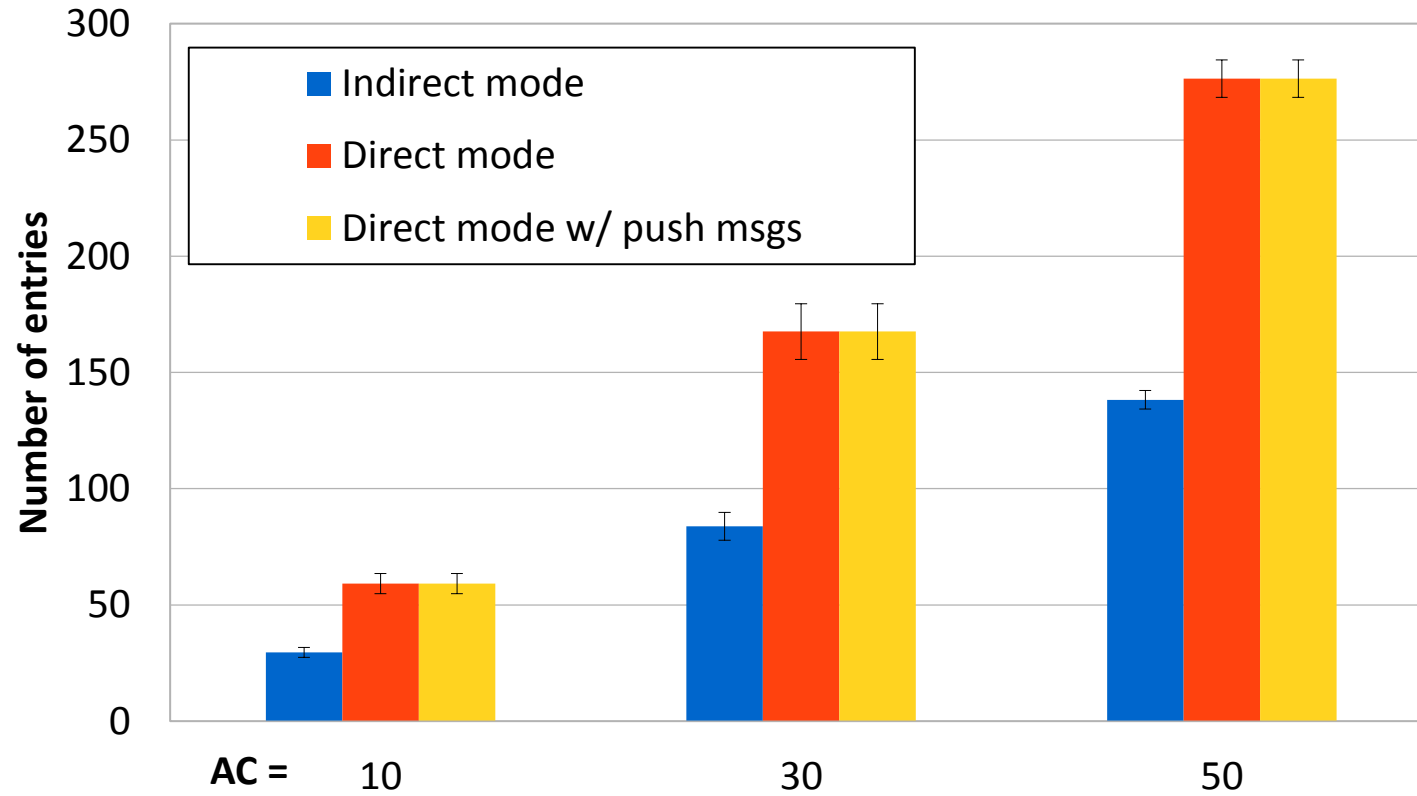

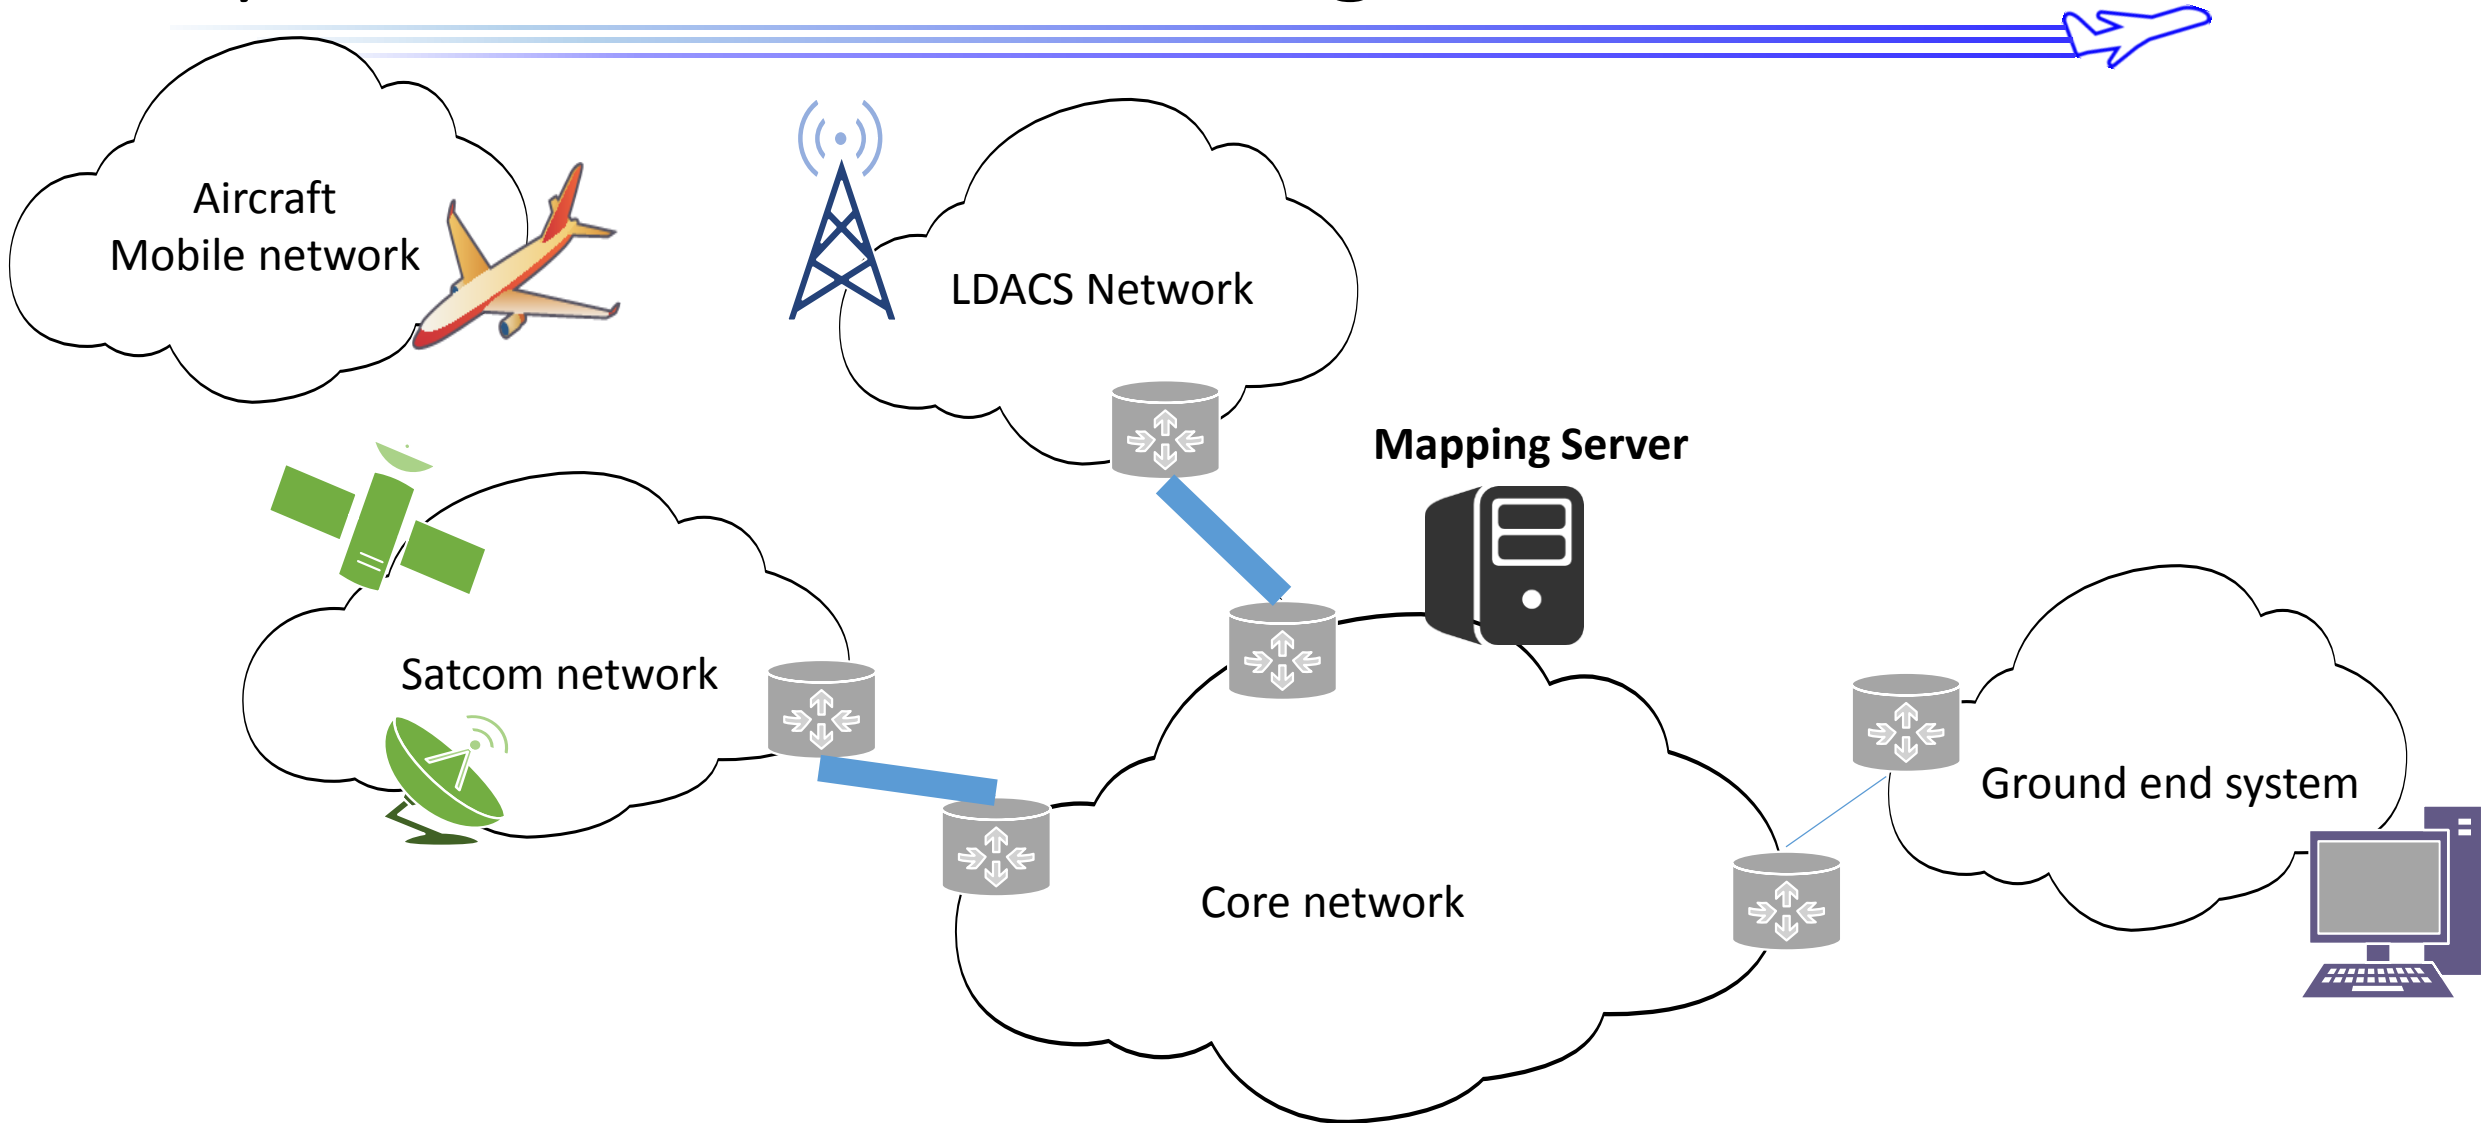

# Simulation Scenario

# System Load: stored entries

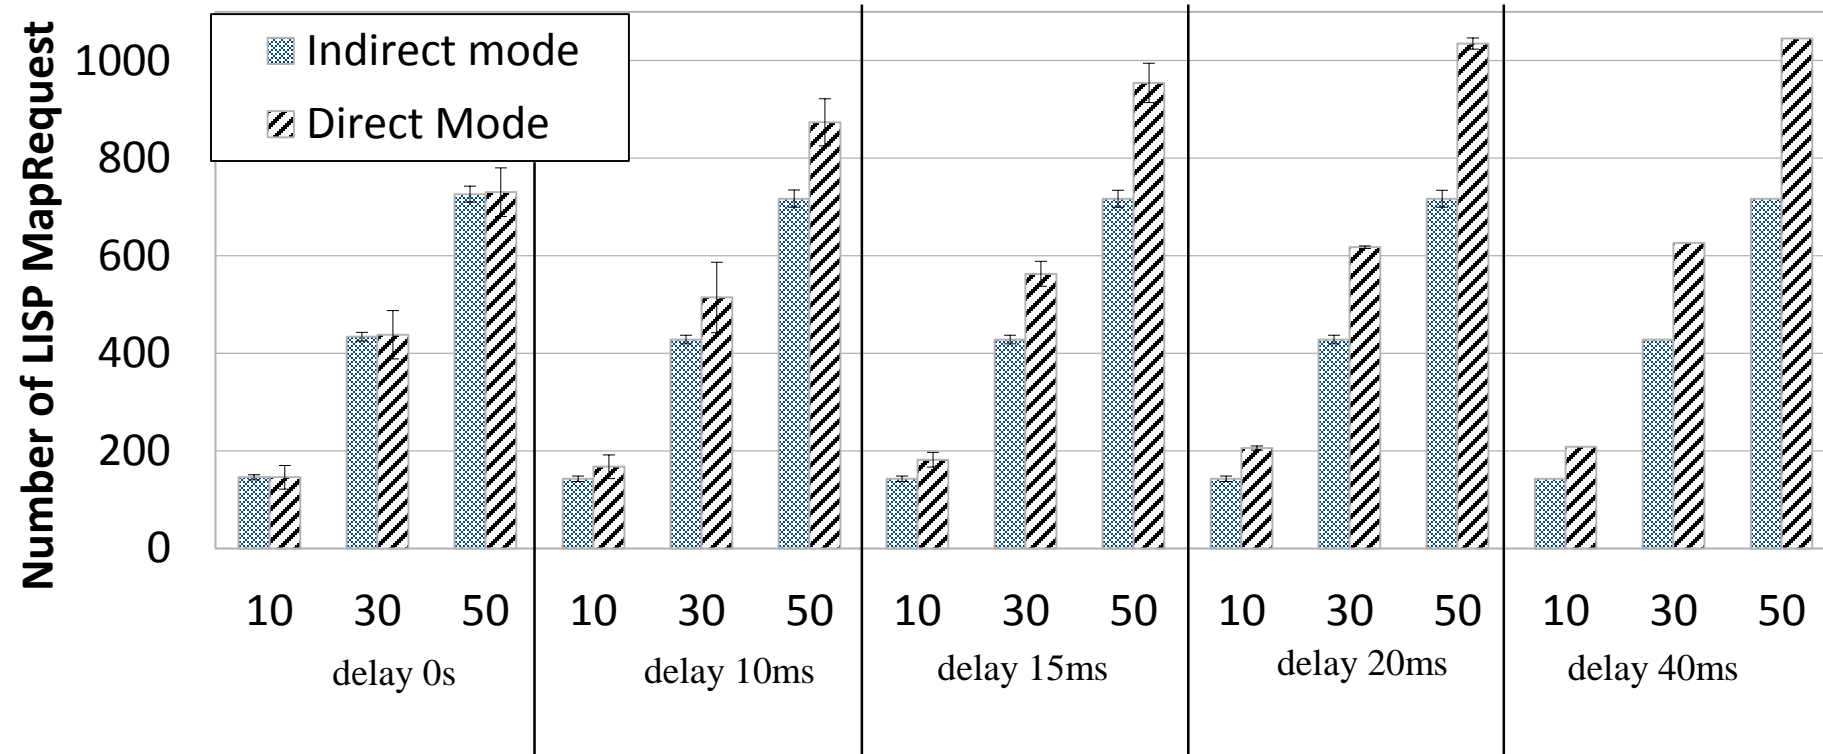

# System Load: # of messages

# System Load: # of messages (2)

# Conclusions and Future Work

---

- SAPIENT + LISP: system-level simulator for FCI and Multilink
- Arbitrarily increase the complexity of domains, keeping the same Router Architecture
- Evaluation of the system LOAD
  
- Move everything to IPv6
- Testing using realistic traffic models and mobility patterns
